Abstract data types and data structures

- An abstract data type (ADT), or abstract data structure, is an object with well-defined operations. For example a stack supports push() and pop() operations
- An abstract data structure can be implemented using different data structures. For example a stack can be implemented using a linked list, or an array
- · Sometimes names, usage is confusingly similar

Ç. Çöltekin, SfS / University of Tübinge

Winter Semester 2020/21 2 / 16

Introduction Abstract data types Algorithms

Arrays in Python

· No built-in array data structure in Python

- · Lists are indexable
- For proper/faster arrays, use the numpy library

List indexing in Python

a = [3, 6, 8, 9, 3, 0]a[0] # 3 a[-1] # 0 a[1:4] # [6, 8, 9] a2d = [[3, 6, 8], [9,3, 0]] a2d[0,1] # 6

Winter Semester 2020/21 6 / 16

Introduction Abstract data types Algorithms

Stacks

- A stack is a last-in-first (LIFO) out data structure
- Two basic operations:
 - push
 - pop

0

C. Cöltekin. SfS / University of Tübinger

• Stacks can be implemented using linked lists (or arrays)

push(5) push(3) pop() 5 3 3 0 0 0

Overview

· Some basic data structures

Introduction Abstract data types Algorithms

- Arrays
- Lists
- Stacks
- Queues

· Revisiting searching a sequence

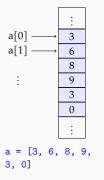

C. Cöltekin, SfS / University of Tübingen

Arrays

• An array is simply a contiguous sequence of objects with the same

Introduction Abstract data types Algorithms

- · Arrays are very close to how computers store data in their memory
- Arrays can also be multi-dimensional. For example, matrices can be represented with 2-dimensional arrays
- · Arrays support fast access to their elements through indexing
- On the downside, resizing and inserting values in arbitrary locations are expensive

Winter Semester 2020/21 3 / 16

Lists

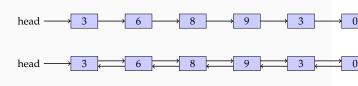

- · Main operations for list ADT are
 - append

Ç. Çöltekin, SfS / University of Tübingen

- prepend
- head (and tail)
- · Lists are typically implemented using linked lists (but array-based lists are also common)

Introduction Abstract data types Algorithms

· Python lists are array-based

Introduction Abstract data types Algorithms

Queues

Ç. Çöltekin, SfS / University of Tübinger

- A queue is a first-in-first (FIFO) out data structure
- Two basic operations:
 - enqueue
 - dequeue
- Queues can be implemented using linked lists (or maybe

enqueue(5) enqueue(3) 0 0

dequeue()

5

3

C. Cöltekin, SfS / University of Tübinger Winter Semester 2020 / 21

Other common ADT

- Strings are often implemented based on character arrays
- Maps or dictionaries are similar to arrays and lists, but allow indexing with (almost) arbitrary data types
 - Maps are generally implemented using hashing (later in this course)
- Sets implement the mathematical (finite) sets: a collection unique elements without order
- · Trees are used in many algorithms we discuss later (we will revisit trees as data structures)

Ç. Çöltekin, SfS / University of Tübingen

Introduction Abstract data types Algorithms

A simple problem: searching a sequence for a value

```
1 def linear_search(seq, val):
     answer = None
     for i in range(len(seq)):
         if seq[i] == val:
             answer = i
     return answer
```

Introduction Abstract data types Algorithms

Is this a good algorithm? Can we improve it?

Ç. Çöltekin, SfS / University of Tübingen

Linear search: take 3

def linear_search(seq, val):

while seq[i] != val:

if i < n or seq[n] == val:</pre>

n = len(seq) - 1

last = seq[n] seq[n] = val

i +=

return i

return None

seq[n] = last

i = 0

else:

Ç. Çöltekin, SfS / University of Tübingen

11

12

Winter Semester 2020/21 10 / 16

• Is this better?

better?

· Any disadvantages?

• Can we do even

Introduction Abstract data types Algorithms

Binary search

```
1 def binary_search(seq, val):
       left, right = 0, len(seq)
while left <= right:</pre>
            mid = (left + right) // 2
if seq[mid] == val:
                 return mid
            if seq[mid] > val:
              right = mid - 1
            else:
               left = mid + 1
10
       return None
11
```

better only if the sequence is sorted.

Winter Semester 2020/21 11 / 16

Introduction Abstract data types Algorithms

Binary search

recursive version

```
1 def binary_search_recursive(seq, val, left=None, right=None):
      if left is None:
         left = 0
      if right is None:
         right = len(seq)
      if left > right:
       return None
      mid = (left + right) // 2
if seq[mid] == val:
         return mid
11
      if seq[mid] > val:
       return binary_search_recursive(seq, val, left, mid - 1)
      else:
       return binary_search_recursive(seq, val, mid + 1, right)
```

```
Studying algorithms
```

- · In this course we will study a series of important algorithms, including
 - Sorting
 - Pattern matching
 - Graph traversal
- For any algorithm we design/use, there are a number of desirable properties

Correctness an algorithm should do what it is supposed to do Robustness an algorithms should (correctly) handle all possible inputs it may receive

Efficiency an algorithm should be light on resource usage Simplicity an should be as simple as possible

Introduction Abstract data types Algorithms

· We will briefly touch upon a few of these issues with a simple case study

```
Linear search: take 2
```

```
def linear_search(seq, val):
    for i in range(len(seq)):
            if seq[i] == val:
                  return i
       return None
```

Can we do even better?

Ç. Çöltekin, SfS / University of Tübingen

• We can do (much)

Ç. Çöltekin, SfS / University of Tübingen

Introduction Abstract data types Algorithms

A note on recursion

- Some problems are much easier to solve recursively.
- · Recursion is also a mathematical concept, properties of recursive algorithms are often easier to prove
- Reminder:
 - You have to define one or more base cases (e.g., if left > right for binary search)
 - Each recursive step should approach the base case (e.g., should run on a smaller portion of the data)
- · We will see quite a few recursive algorithms, it is time for getting used to if you are not

Exercise: write a recursive function for linear search.

C. Cöltekin, SfS / University of Tübingen Winter Semester 2020/21 14 / 16 Ç. Çöltekin, SfS / University of Tübingen

Winter Semester 2020 / 21 15 / 16

Introduction Abstract data types Algorithms

Summary

- This lecture was a slow review of some basic data structure and algorithms.
- We will assume you know these concept, revise your earlier knowledge if needed

Nevt

- A few common patterns of algorithms
- Analysis of algorithms
